Finding Elements (getElementsByClassName)

The getElementsByClassName searches through the contents of an element node and retrieves all elements that have the given string in their class attribute and returns them as an array-like object.

```
<p>My ostrich Gertrude:</p>
<p class="test"><img id="gertrude" src="img/ostrich.png"></p>
```

```
<script>
let link = document.body.getElementsByClassName("test");
console.log(link.length);
</script>
```

- link is an HTMLCollection
- HTMLCollection.length returns the number of items in the collection.
