Finding Elements (getElementsByTagName)

The getElementsByTagName method collects all elements with the given tag name that are descendants of a node and returns them as an array-like object.

```
<p>My ostrich Gertrude:</p>
<p><img id="gertrude" src="img/ostrich.png"></p>
```

```
<script>
 let link = document.body.getElementsByTagName("p");
 console.log(link.length);
</script>
```

- link is an HTMLCollection
- HTMLCollection.length returns the number of items in the collection.
